# U.S. IMPORTS OF PRODUCTS

#### **FOREWORD**

During the past decade, impressive increases have been recorded in U.S. imports of horticultural commodities. In 1969, these imports reached an alltime high for the eighth year in succession. The principal participants in this growth were Mexico, Taiwan, Spain, Japan, Canada, and France.

The purpose of this report is to apprise the U.S. industry of the composition, trends, and sources of these imports.

J. W. Stewart, Director Fruit and Vegetable Division

# U.S. Imports of HORTICULTURAL PRODUCTS

By Richard B. Schroeter<sup>1</sup>

#### THE IMPORT SITUATION

The value of U.S. imports of horticultural products reached an alltime high of \$613 million in 1969, exceeding levels of a year earlier by 6 percent or \$37 million.<sup>2</sup> From 1956 to 1969, these imports showed a strong upward trend, with value in 1969 almost three times that of 1956.

As a percentage of the value of total U.S. agricultural imports, these imports rose from 5 percent in 1956 to a high of 12 percent in 1969.

Of the seven commodity groups within the horticultural family, fruits and vegetables exhibited the largest absolute growth. The value of fresh and processed vegetable imports, the leading commodity group, reached \$183 million in 1969 for a nearly five-fold increase over 1956. This growth resulted in a rise in the share of vegetable imports to 30 percent in 1969, as compared with 18 percent in 1956. Imports of fresh and processed fruit were valued at \$181 milion in 1969, 168 percent above the 1956 value. However, their relative share of total horticultural imports generally remained around 30 percent during the period.

With the exception of nursery stock, imports of the remaining commodity groups—wines (including brandy), hops, citrus oils, and tree nuts—also showed substantial growth during the 1956-69 period. Receipts of wines, consistently ranking third in the horticultural group since 1959, more than tripled in quantity and value during the interval, while their relative share of total value rose from 18 percent to 22 percent. During the period, imports of hops rose 2½ times and those of

Tree nut imports in 1969, at \$82 million, were 70 percent above the 1956 value. Despite this growth (most of which has occurred since 1965), their share of total horticultural imports declined from 23 percent to 13 percent. Nursery stock imports showed the least growth of all the commodity groups. These were valued at \$16 million in 1969, 26 percent above the value imported in 1956.

#### **Principal suppliers**

Far the largest beneficiary from this overall growth in U.S. horticultural imports was Mexico. Spain, Taiwan, Japan, Canada, and France were other noteworthy participating countries. Contributions of these suppliers, with the exception of France, were confined mostly to fruit and vegetable items. Wines dominated the increase in imports from France.

Imports of fruits and vegetables from Mexico were valued at \$145 million in 1969, almost 8½ times the 1956 level. This value represented 40 percent of 1969 U.S. fruit and vegetable imports, as compared with 31 percent the previous year. Just under three-quarters of these Mexican supplies consisted of fresh vegetables, primarily cucumbers, onions, peppers, and tomatoes. Fresh and frozen fruits, canned pineapple, and lime oil were also significant import items.

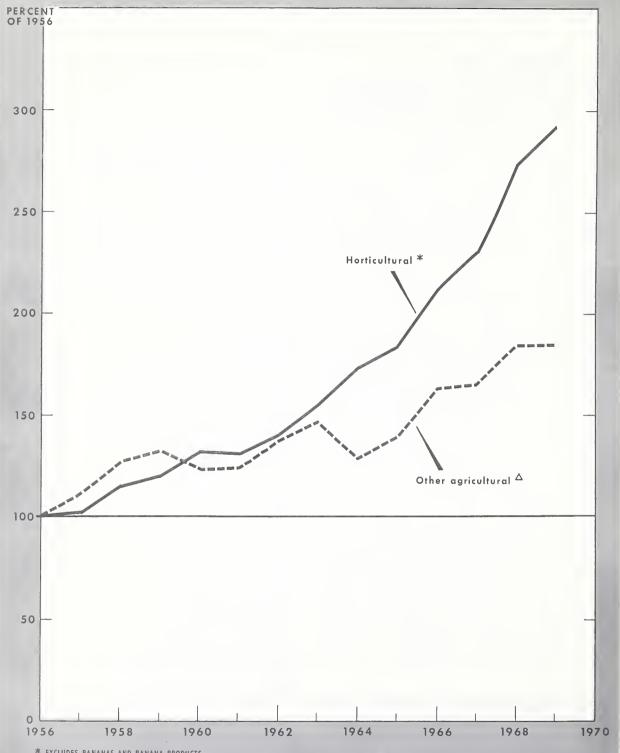

In 1969 shipments of fruits and vegetables from Spain totaled \$43.4 million, a decline from the previous year but \$25.7 million more than in 1956. About 60 percent of this increase consisted of olives, with canned vegetables accounting for most of the remainder.

A more spectacular increase occurred in imports of fruit and vegetables from Taiwan. They rose in value from only \$500,000 in 1956 to a record-high \$25.3 million in 1969, registering an increase every year since 1958. Canned mandarin oranges, canned pineapple, and canned mushrooms accounted for most of this gain.

citrus oils 3½ times the corresponding values of 1956. They represented, in total, only 3 percent of all horticultural imports in 1969.

<sup>&</sup>lt;sup>1</sup>Mr. Schroeter, formerly Agricultural Economist with the Fruit and Vegetable Division, FAS, is now Assistant U.S. Agricultural Attache to the European Community, Brussels. <sup>2</sup>The term "horticultural products," as used in this report, embraces the following commodity groups; Fruits and preparations (excluding bananas), vegetables and preparations (excluding soybeans and dried beans and peas), tree nuts, wines (including brandy), hops, citrus oils, and nursery stock.

#### VALUE INDICES OF U.S. IMPORTS OF HORTICULTURAL AND OTHER AGRICULTURAL COMMODITIES

<sup>\*</sup> EXCLUDES BANANAS AND BANANA PRODUCTS.

A SUPPLEMENTARY IMPORTS ONLY.

Imports of fruits and vegetables from Japan also showed phenomenal growth, totaling \$19.2 million in 1969 compared with less than \$4 million in 1956. Two-thirds of these imports from Japan consisted of canned mandarin oranges, which have tended to level off in recent years.

The contribution of France to growth in U.S. horticultural imports was confined largely to wines and brandy. About \$63 million worth of those commodities entered the United States from France in 1969, almost one-half of the total value imported during that year. In 1956, wine and brandy imports from France totaled \$20.2 million.

#### Reasons for growth

Reasons for the expansion in U.S. horticultural imports are many and varied. Perhaps the basic contributing factor has been the sustained level of economic growth within the United States throughout much of the past decade. This market, in sharp contrast to the depressed economies of many producing countries, provided a natural target for imports. With the appearance of new vigor in the local economies in many of these countries so critically dependent upon export earnings, the attractive U.S. market provided an ideal incentive to further development and expansion of their horticultural industries. Their intensive and rapid adaptation of American know-how, with regard to both cultural and marketing practices, coupled with certain competitive advantages as well as occasional spurts in demand arising from temporary disturbances in the U.S. producing scene, facilitated increasing penetration of the U.S. market.

Given this attractive market setting, lower foreign production costs have been the most important single factor enabling foreign supplies to compete effectively. Although production costs in other countries have grown over time, the absolute increases have been nowhere nearly so large as those of the U.S. horicultural industry. This continuing foreign advantage of lower production costs has permitted acquisition of supplies at a price level far below that needed to sustain U.S. grower interest. In Mexico, for example, strawberry freezers are able to attract ample supplies of the raw product at a grower price level of 5-7 cents per pound. This is substantially less than the amount necessary to break even in U.S. producing areas.

Weather disturbances in U.S. producing areas have also played an important role in determining types of imports into this country. Citrus provides a classic example. The series of freezes curtailing production of oranges in Florida during 1957 through 1962 generated considerable interest in the U.S. market on the part of

other citrus suppliers. Interim shortages, and attendant high price levels gave added impetus to establishment and expansion of citrus processing facilities, particularly in the Caribbean area and in Latin America. Some of these operations were oriented specifically toward the (then) very receptive U.S. market. Mexico and Brazil, in particular, exported considerable quantities of orange juice to this country during the period of supply shortages. Mexico became a prominent supplier of fresh oranges, as well.

A further stimulus to U.S. import activity stems indirectly from governmental policies. A number of national governments have actively encouraged the production of readily marketable fruits and vegetables in order to alleviate marketing problems caused by the overproduction of certain basic crops. In Mexico, for example, the national and local governments have encouraged citrus plantings, urging a shift away from such chronic problem areas as coffee, henequen, and bananas.

And, finally, the rising level of prosperity in the United States has also brought forth new consumer attitudes. To many, the mere possession of goods of foreign origin has become a symbol of social status. This has been particularly striking in the use of wines and brandies.

#### THE SITUATION BY COMMODITY

#### Fresh and processed fruit

U.S. imports of fresh and processed fruits (excluding bananas) were valued at \$181.1 million in 1969, 168 percent above the level of 1956. Almost three-fourths of these imports consisted of processed fruit, whose import value in 1969 was \$134 million or more than 2½ times that of 1956. Accounting for 56 percent of the total increase were four commodities—canned mandarin oranges, canned pineapple, frozen strawberries, and olives.

Imports of *canned mandarin oranges* climbed to a record 79.5 million pounds in 1969, more than 5½ times the quantity imported in 1956. Eighty percent arrived from Japan, while Taiwan's share increased to 19 percent from zero in 1956. Total value from all sources reached \$15.1 million.

Over 244 million pounds of *canned pineapple*, valued at \$28.1 million, entered the United States in 1969, more than triple the amount in 1956. Nearly 79.8 million pounds, one-third the total volume imported in 1969, entered the U.S. market from Taiwan, down slightly from the previous year. Approximately 76.4 million pounds arrived from the Philippines. Imports from Malaysia and Mexico, two other important sources

with considerable growth potential, totaled 37.4 million and 27.1 million pounds respectively in 1969.

Frozen strawberry imports, 95 percent of which came from Mexico, were valued at \$15.6 million in 1969, ten times the value imported in 1956. In volume, they totaled 93.0 million pounds, 17.9 million above the level of a year earlier and over eight times the quantity imported in 1956. Imports of frozen blueberries fell almost 40 percent to 8.7 million pounds in 1969. Close to 90 percent of these imports came from Canada, with Poland supplying most of the remainder.

Glace cherry imports increased in value from \$1.2 million in 1956 to \$2.8 million in 1969, as usual coming almost exclusively from France. Most *olive* imports in 1969 came from Spain, predominantly in a stuffed form. They were valued at \$35.8 million, almost \$5 million below 1968 levels. The bulk of *jam* and *jelly* imports, at \$2.4 million, originated in Canada and the United Kingdom.

Imports of dried fruit were valued at \$7.4 million in 1969. Seventy percent of these imports consisted of dates, dried apricots, and fig paste. Imports of dates virtually all from Iran and Iraq, were off one-third from the 1956 value to \$2.2 million. Forty-one percent consisted of unpitted dates, whereas before 1963, practically all date imports had entered the United States in a pitted form. An infestation problem in originating countries was a major reason for prompting the partial switch to unpitted dates. Imports of dried apricots jumped to \$1.6 million in 1969, 2 1/3 times the previous year's level. Australia, Turkey, and Iran supplied more than 80 percent. Over \$1.3 million of fig paste entered the United States in 1969, 50 percent above 1956 levels. All came from Portugal, Spain, and Turkey.

Fruit juice imports declined to \$12.9 million in 1969 from \$14.3 million the previous year. A large decrease in imports of concentrated orange juice was partially offset by an increase in some other juices, mainly apple juice. Low priced apple juice from Europe found a home in the United States and ranked as the major fruit juice imported in 1969. Imports in that year totaled 14.1 million gallons (single-strength equivalent) valued at \$3.5 million. This compares with only 2.5 million gallons in 1967. While imports from Canada were the second largest (3.1 million gallons), virtually all the remaining supplies came from Europe notably Switzerland, France, Austria, and Greece. Most imports were in the concentrated form.

Pineapple juice imports, valued at \$2.3 million in 1969, were one-fifth below the previous 5-year average,

but 16 percent above 1968. They originated almost entirely in the Philippines.

Concentrated *oranged juice* imports in 1969 totaled 6.1 million gallons (single-strength equivalent), valued at \$2.6 million. Brazil, the principal supplier, accounted for 3.8 million gallons.

U.S. imports of *fresh fruit* in 1969 rose to a record \$47.1 million, only a small increase over the previous year but approaching three times the 1956 value. All major categories except fresh pineapples have registered substantial gains since 1956.

Imports of *strawberries*, valued at only \$18,000 in 1956, have experienced spectacular growth, with 11 consecutive yearly increases. In 1969, 46.5 million pounds of strawberries, with a value of \$7.8 million, entered the United States. Virtually all arrived from Mexico.

Imports of *melons* also have exhibited significant growth. Their 1969 total of 255.4 million pounds was approximately 16 million pounds below the record-large imports of 1965 but 2½ times the quantity imported in 1956. Mexico supplied 88 percent of these imports, over half of which consisted of cantalopes.

Fresh *pear* imports registered an impressive gain in 1969, rising to 30.8 million pounds from 22.6 million the preceding year. Of particular note has been the emergence in recent years of Southern Hemisphere countries as prominent sources of supply. In 1969, imports of Australian pears increased to 8.8 million pounds from zero 2 years earlier. Chile and South Africa have also increased their shipments to the United States, while Argentina has been the major supplier throughout most of 1956-1969. Imported *apples* from Australia, New Zealand, and South Africa also increased substantially in 1969, although the total volume of imported apples declined from the previous year because of fewer receipts from Canada.

Mexico was the principal source of 1969 orange imports, which fell 37 percent from the record 1968 level to 90 million pounds. Of this total, just over 70 percent was supplied by Mexico, compared with virtually all in 1956. Israel accounted for 26 percent of the volume in 1969.

#### Fresh and processed vegetables

U.S. imports of fresh and processed vegetables reached a record \$183.2 million in 1969, approaching five times the 1956 value. Two-thirds of the 1969 imports consisted of fresh vegetables, of which more than 80 percent came from Mexico.

The overall increase in imports of horticultural products is comprised of many individual success stories. One of the most spectacular is certainly fresh *tomatoes*.

The value of imports increased more than 10 times since 1956 and reached \$68.4 million in 1969—more than any other item in the horticultural family. Almost 450 million pounds were imported in 1969, 15 percent above the previous year's total. Mexico supplied virtually all of these imports and was also the principal supplier of cucumbers, peppers, onions, garlic and squash. Mexico displaced the Bahamas in 1965 as the leading source of cucumbers and by 1969 was accounting for 82 percent of the 134.8 million pounds imported. The 1969 level was three times the 1956 imports and 74 percent above those in 1968.

Carrot imports also registered impressive gains. Imports in 1969 reached 61.9 million pounds, valued at a record \$2.6 million, or 13 times the value imported in 1956. Canada supplied almost all these and, in addition, had virtually a monopoly on the 1969 import supply of potatoes, turnips, and rutabagas.

In the family of *processed vegetables*, six items predominated—canned and dried mushrooms, canned tomatoes, tomato paste, canned peas, and pickled vegetables. About 22.7 million pounds of *canned mushrooms*, valued at \$12.7 million, entered the United States in 1969, compared with only 2 million pounds in 1956. Taiwan was the major source of these imports. The penetration of the U.S. market for canned mushrooms by Taiwan has been spectacular, with a rise from a "zero" status in 1960 to 18.8 million pounds in 1969. Imports of dried mushrooms were valued at \$1.7 million in 1969, triple the value imported in 1956 but below the high established in 1967 of \$2.1 million; most came from Japan and Chile.

Tomato paste and sauce imports in 1969 fell 45 percent from the year earlier to 87.4 million pounds. They were valued at \$13.1 million. Portugal supplied 61 percent of these imports, followed by Spain with 12 percent. Arrivals of significant quantities of paste from Portugal did not begin until 1961, but they rose rapidly, reaching a record 159.6 million pounds, valued at \$22.9 million, in 1968. The subsequent sharp drop in 1969 came as a result of large domestic supplies and corresponding low prices.

Italy was the largest supplier of *canned tomato* imports in 1969, which totaled 110.2 million pounds with a value of \$10.4 million. While Italian imports have fluctuated widely since 1956, Spain has shown the most growth. Spanish shipments totaled 31.7 million pounds in 1969, down 10.2 million from the previous year but far above the 1956 level of 24,000.

Canned peas, valued at \$1.4 million in 1969 compared with \$1.7 million the previous year, came primarily from the Dominican Republic. The bulk of the

pickled and brined vegetables arrived from Mexico and Mediterranean countries.

#### Tree nuts

Tree nut imports were valued at \$81.7 million in 1969, 70 percent above the 1956 value. Many individual items were at their alltime highs. About 40 percent of these nut imports in 1969 were from India.

Cashews represented 57 percent of the 1969 imports. They were valued at \$46.4 million, \$22.4 million above the 1956 value. India was the dominant exporter in this growth, supplying two-thirds of the 1969 imports, compared with 95 percent in 1956. Though a smaller participant, Mozambique is growing in significance. Cashews valued as \$9.6 million entered the United States from this country in 1969, compared with only \$667,000 in 1956.

Imports of *pistachio nuts* established an alltime high of \$15.9 million in 1969, four times the value imported in 1956. Iran was the leading source of these imports, while Turkey was the most prominent supplier of *walnuts* and *filberts*. Walnut imports totaled \$1.6 million in 1969. Imports of filberts, at \$4.3 million, rose to the highest value for the observed period, as did *chestnut* imports, at \$2.9 million. Italy supplied almost all the chestnuts. *Brazil nut* imports were worth \$8.4 million, 23 percent below the 1968 level.

#### Wines

Total wine and brandy imports increased every year from 1956 to 1969, rising to \$132.9 million in the latter year. This was 3½ times the value imported in 1956. Almost one-half of these imports originated in France. Other prominent suppliers were Italy, Spain, West Germany, and Portugal.

The largest growth in this horticultural group occurred in *table wines*. They were valued at \$66.7 million in 1969 six times the value imported in 1956, and represented one half of all wine and brandy imports. France supplied one-half the table wines in 1969 and was also the leading source of *sparkling wines* and *brandy*. Brandy imports increased to \$15.7 million in 1969, and sparkling wines were valued at \$19.3 million.

Nearly \$14.3 million worth of dessert wines entered the United States in 1969, the highest value imported in the 1956-69 period and more than three times the 1956 level. Spain was by far the leading source. Imports of vermouth, of which just under 80 percent came from Italy, also increased steadily throughout the period under observation.

#### Hops

U.S. imports of hops totaled 9.7 million pounds in 1969 with a value of \$8.9 million. This 1969 value was 16 percent below 1968 levels but more than  $2\frac{1}{2}$  times the value imported in 1956. West Germany supplied nearly two-thirds of 1969 imports, with Yugoslavia contributing an additional 29 percent. Before 1965, Yugoslavia had been a much larger supplier, in some years the major one.

#### Citrus oils

Citrus oil imports consisted of bergamot, grapefruit, lemon, lime, and orange oil. They rose to a high of \$12.3

million in 1968, from only \$2.6 million 12 years earlier, but fell to \$9.4 million in 1969. Approximately 45 percent of the 1969 imports consisted of lime oil, primarily from Mexico. Italy was the prominent source of bergamot and lemon oils, which made up most of the remaining oil imports.

#### Nursery stock

Imports of nursery stock demonstrated very little growth until recently. They were valued at \$16.3 million in 1969, 26 percent above the 1956 value. About 80 percent of the imports originated in the Netherlands, and most of them were bulbs, with tulip bulbs alone accounting for 38 percent of the total.

## STATISTICAL APPENDIX HORTICULTURAL COMMODITIES: U.S. imports by commodity group, 1956-69<sup>1</sup>

<sup>&</sup>lt;sup>1</sup> Imports for consumption, excl. banana products.

<sup>2</sup> Prior to 1964 includes other prepared or preserved cherries except those dried or in brine.

<sup>3</sup> Quantities imported have been converted from gallons to pounds at the following rates (by TSUS no.): 148.42, 6.5 pounds per gallon; 148.44, 5.7 pounds; 148.46, 6.5 pounds; 148.48, 5.7 pounds; 148.50, 5.4 pounds.

<sup>4</sup> Excluding fig paste.

<sup>5</sup> Frozen strawberry imports prior to Sept. 1963 are limited to frozen berry imports from Mexico. Such berries are believed to have consisted almost entirely of strawberries and to have represented virtually all frozen strawberry imports,
